Coverage

Routes

The Routes API returns structured voyage estimates between a defined origin and destination, including total distance, ECA and HRA coverage, canal crossings, start and end timestamps and a simplified route geometry. It enables applications to retrieve all route-related attributes and timestamps in a single, structured response. Rate limit is 300 requests per minute. Trial users are limited to 500 requests per day.

Download Specification

For a quick introduction with practical examples, see the *Routes API tutorial*.

JSON

Get route

Request

GET /v2/maritime/routes

Query Parameter

`originType` string

Defines how the origin location is specified and used as the starting point of the estimated route.

Possible values

`originValue` string

Specifies the origin location used as the starting point of the estimated route. Its format and meaning depend on the selected originType:
• imo – for example 9271248
• mmsi – for example 257739000
• vesselUid – identifier of the vessel as assigned by MarineTraffic (for example 308459)
• coordinates – provided as longitude,latitude (for example -170.2,10.12345)
• port – accepts either a UN/LOCODE (for example USHOU) or a port identifier assigned by MarineTraffic (for example 919)

Note: When the origin is specified using a vessel identifier (imo, mmsi, or vesselUid), the routing engine factors in the vessel's actual dimensions (length, beam, draft) and excludes any route segment the vessel cannot physically transit. For example, a vessel too large for the Panama Canal will not be routed through it, even if that would otherwise be the shortest path.

`destinationType` string

Defines how the destination location is specified. The selected location is used as the end point of the estimated route.

Possible values

coordinates port

`destinationValue` string

Specifies the destination location used as the end point of the estimated route. Its format and meaning depend on the selected destinationType:

example USHOU) or a port identifier assigned by MarineTraffic (for example 919)

`avoidCanals` string[] optional

List of canals to strictly avoid when estimating the route. The estimated route will never pass through the specified canals.

Possible values

KIEL PANAMA SUEZ

`avoidZones` string[] optional

List of zones to avoid when estimating the route. Avoidance is soft: the route estimation attempts to minimise time spent inside the specified zones, but full avoidance may not be possible for all routes.

Possible values

ECA HRA

`startDate` string optional

Start date and time used for route estimation, in ISO 8601 format (YYYY-MM-DDTHH:MM:SSZ), for example 2025-12-22T00:00:00Z. If not specified, the time of the API call (UTC) is used as the start time.

`speed` string optional

Speed used to estimate the route's ETA, expressed in knots. Accepts an integer or decimal value (for example 17 or 12.5). This parameter is optional:
• If provided, it overrides any other speed source and is used directly for the ETA calculation.
• If omitted and a vessel identifier is specified, the vessel's actual average speed

• If omitted and no vessel identifier is specified, a default speed profile is used.

Response

200 application/json object

`distance` integer

Total route distance, in nautical miles.

`distanceEca` integer

Portion of the route distance inside Emission Control Areas (ECA), in nautical miles.

`distanceHra` integer

Portion of the route distance inside High Risk Areas (HRA), in nautical miles.

`canalCrossing` string[]

List of canals crossed by the estimated route.

Possible values

PANAMA SUEZ KIEL

`startDate` string

Route estimation start date-time in UTC (ISO 8601, YYYY-MM-DDTHH:MM:SSZ).

`endDate` string

Estimated time of arrival (ETA) at the projected destination, based on the computed route, in UTC (ISO 8601, YYYY-MM-DDTHH:MM:SSZ).

`route` string

Route geometry as a WKT LINESTRING in WGS84 (longitude latitude pairs).
